Microtubules cytoskeleton component

- Tubular polymer composed of protofilaments of $\alpha\beta$ -tubulin heterodimers
- Dynamic structure regulated by MTs Associated Protein (MAP)

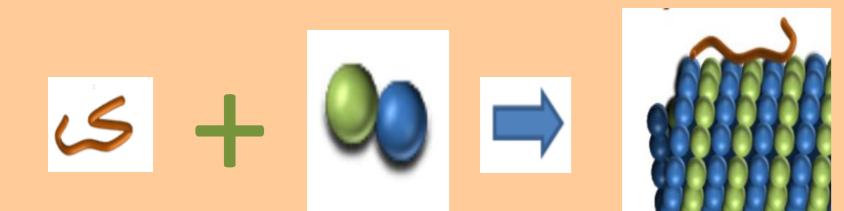

Tau is a MAP found in nerve cells

Function

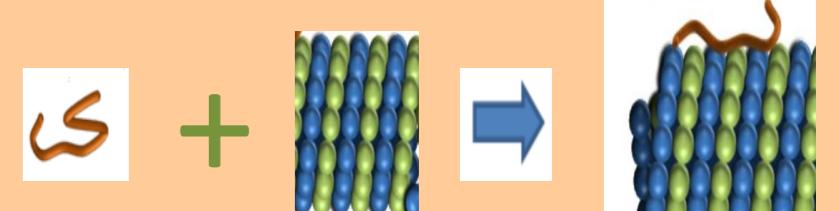

- Stabilize MTs and promote their assembly
- In numerous neurodegenerative diseases called Tauopathies (Alzheimer disease)

Structure

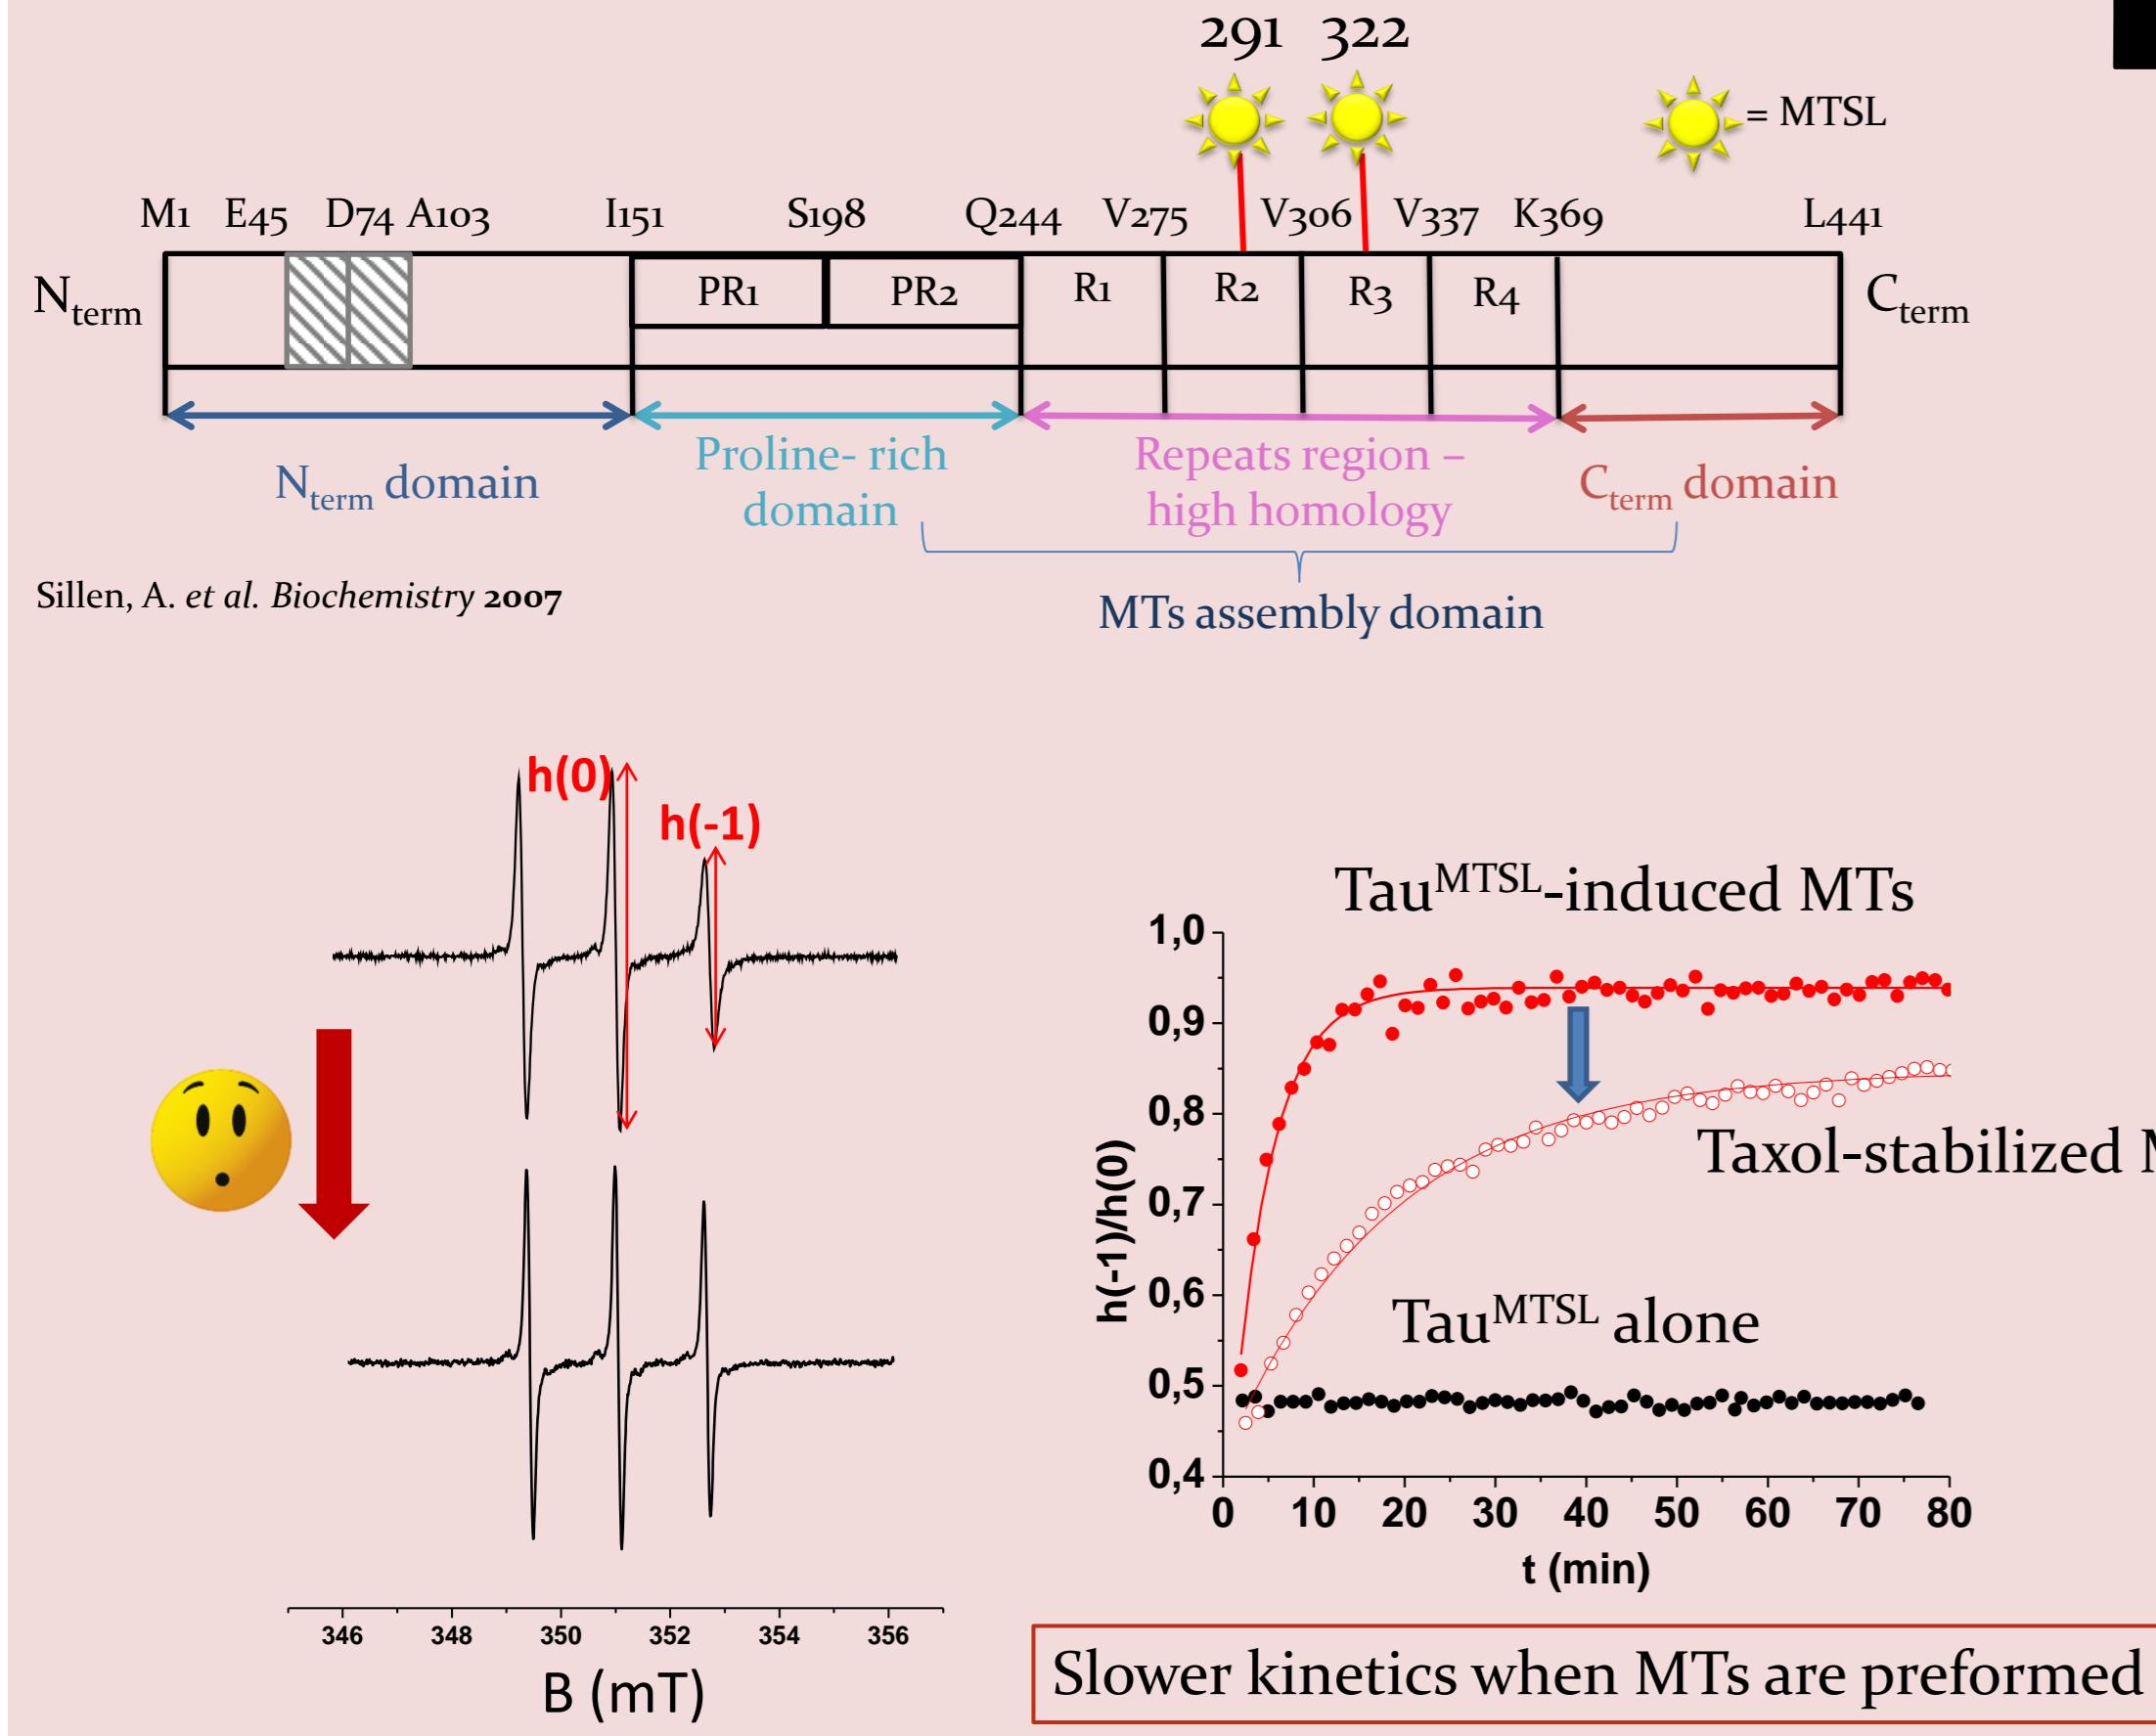

- Very long Intrinsically Disordered Protein (IDP)
- Imperfect Repeats Region
- Tau remains extended and dynamics upon binding
- Where / how does Tau bind to MTs ?

Objective: to study Tau/MTs interaction

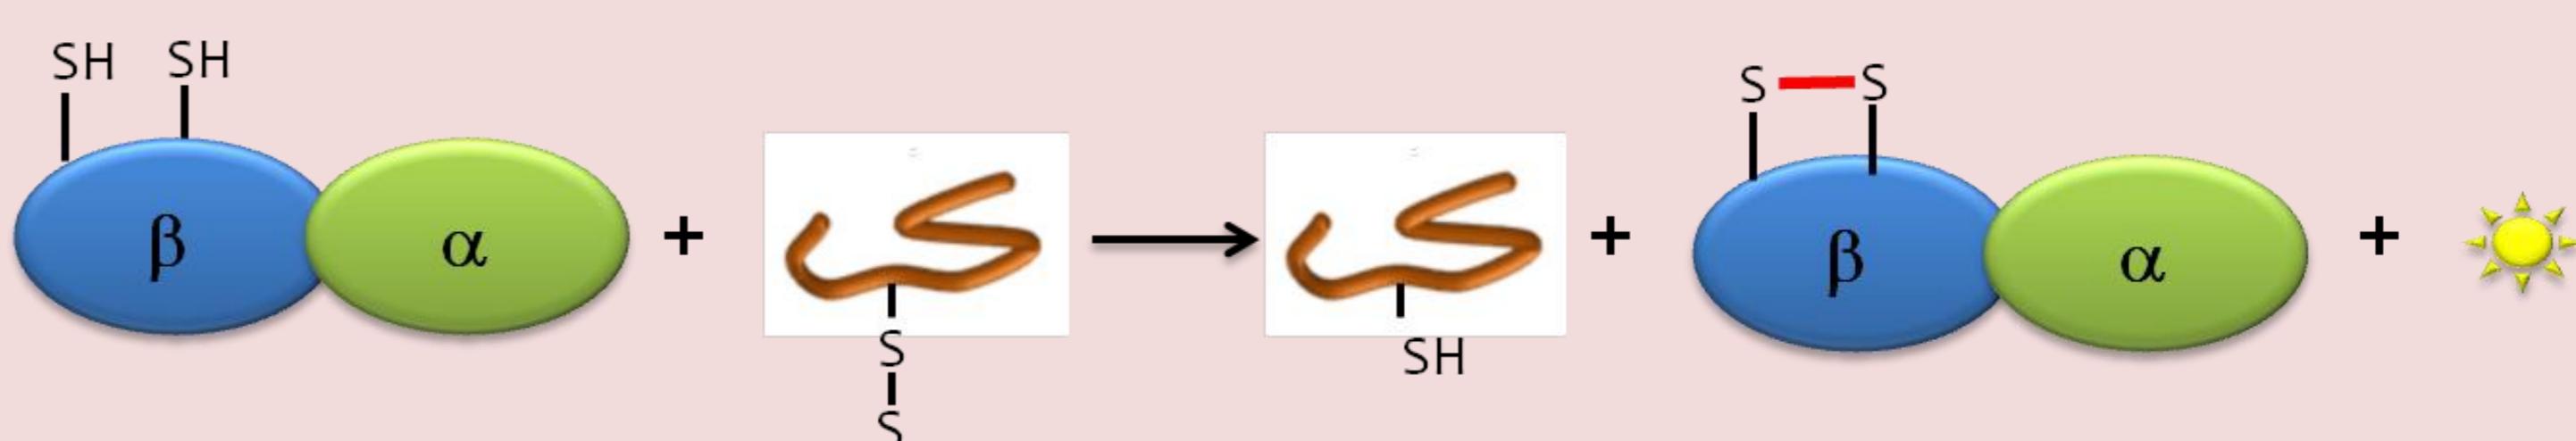

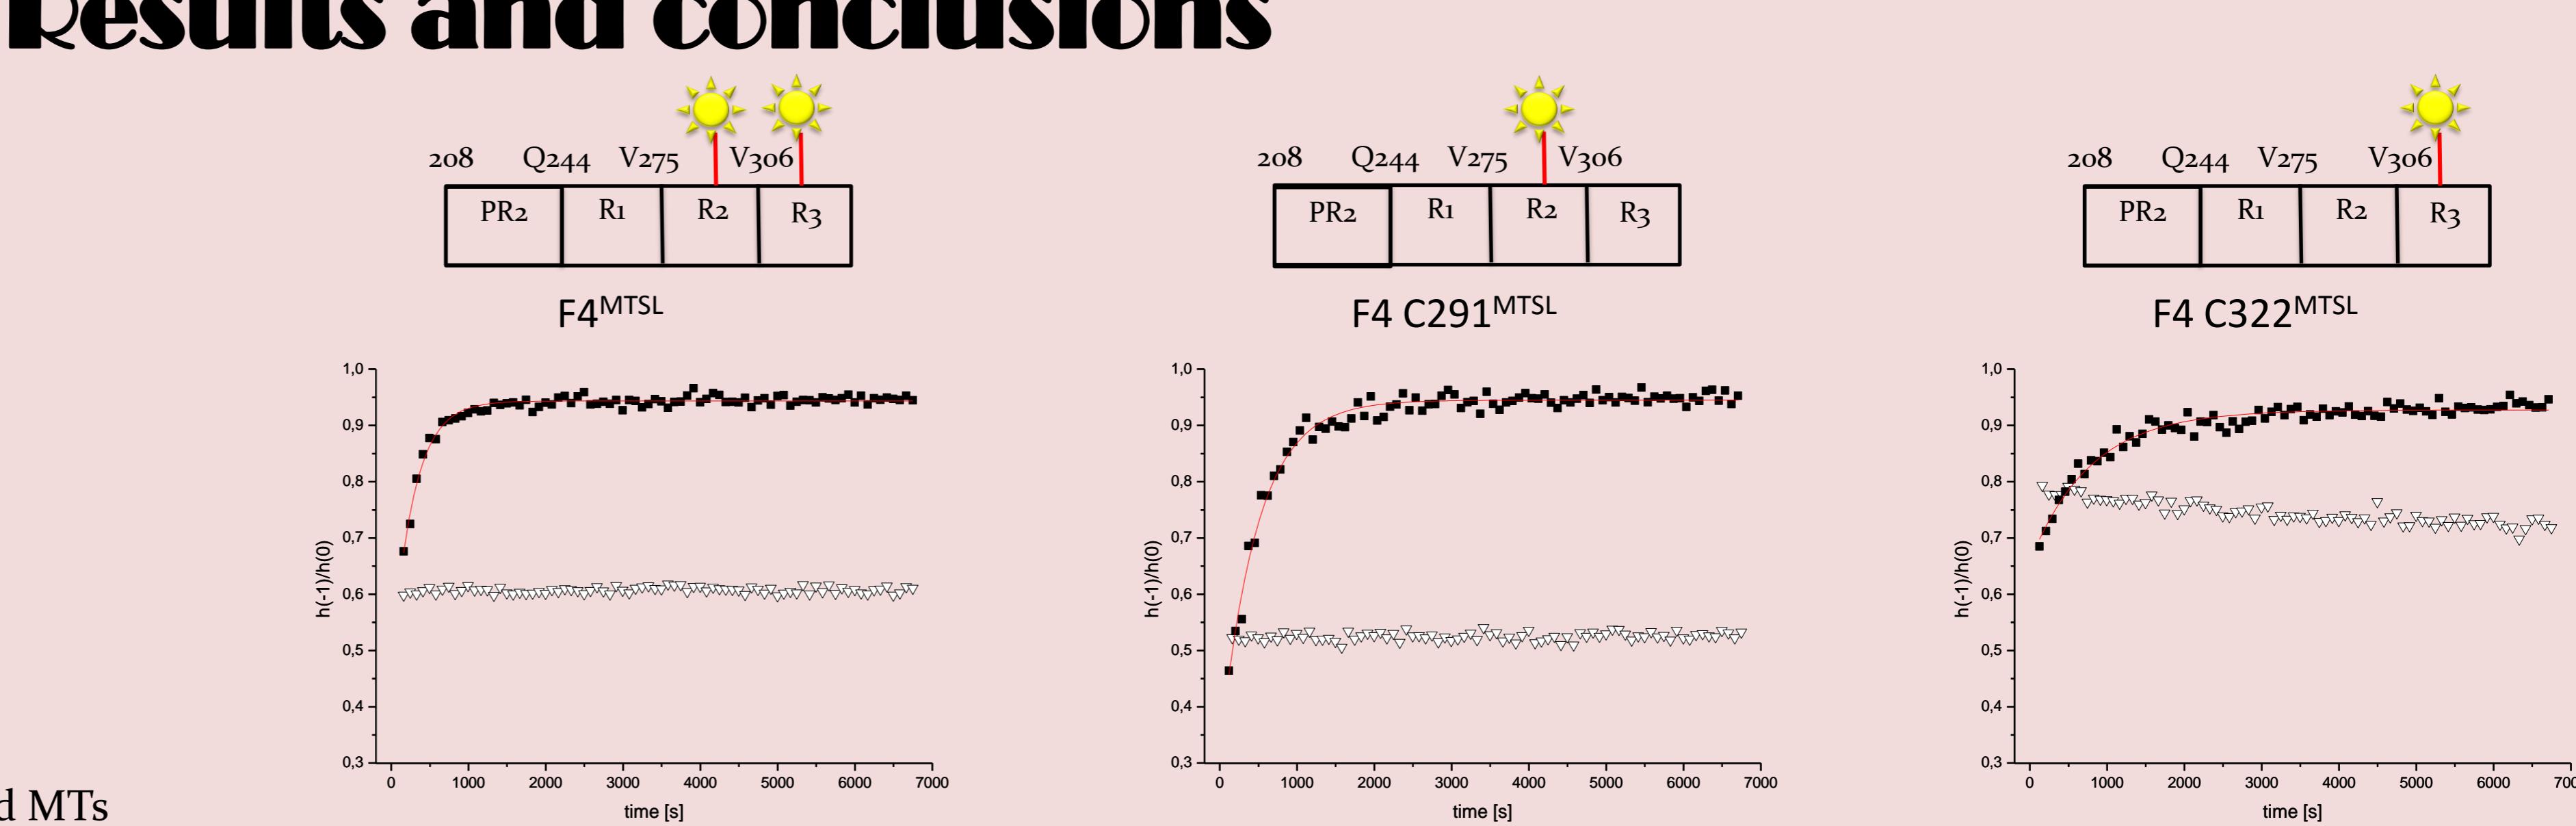

Results and conclusions

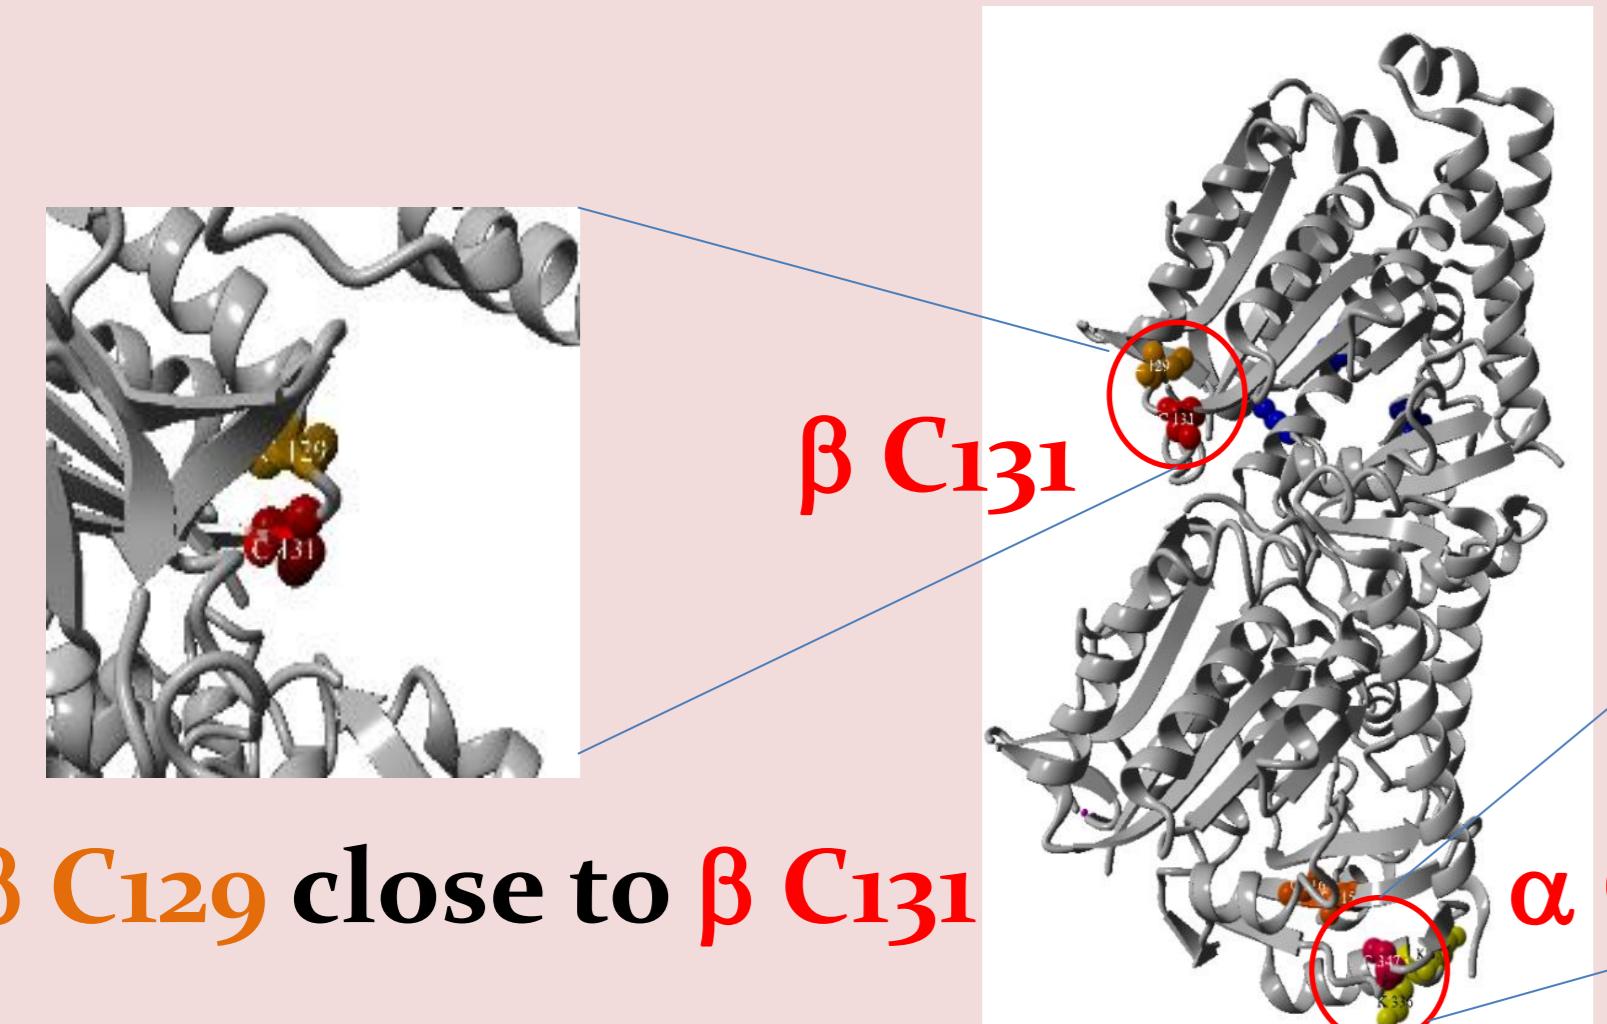

Slower kinetics when MTs are preformed

Unexpected release of the label upon interaction !!

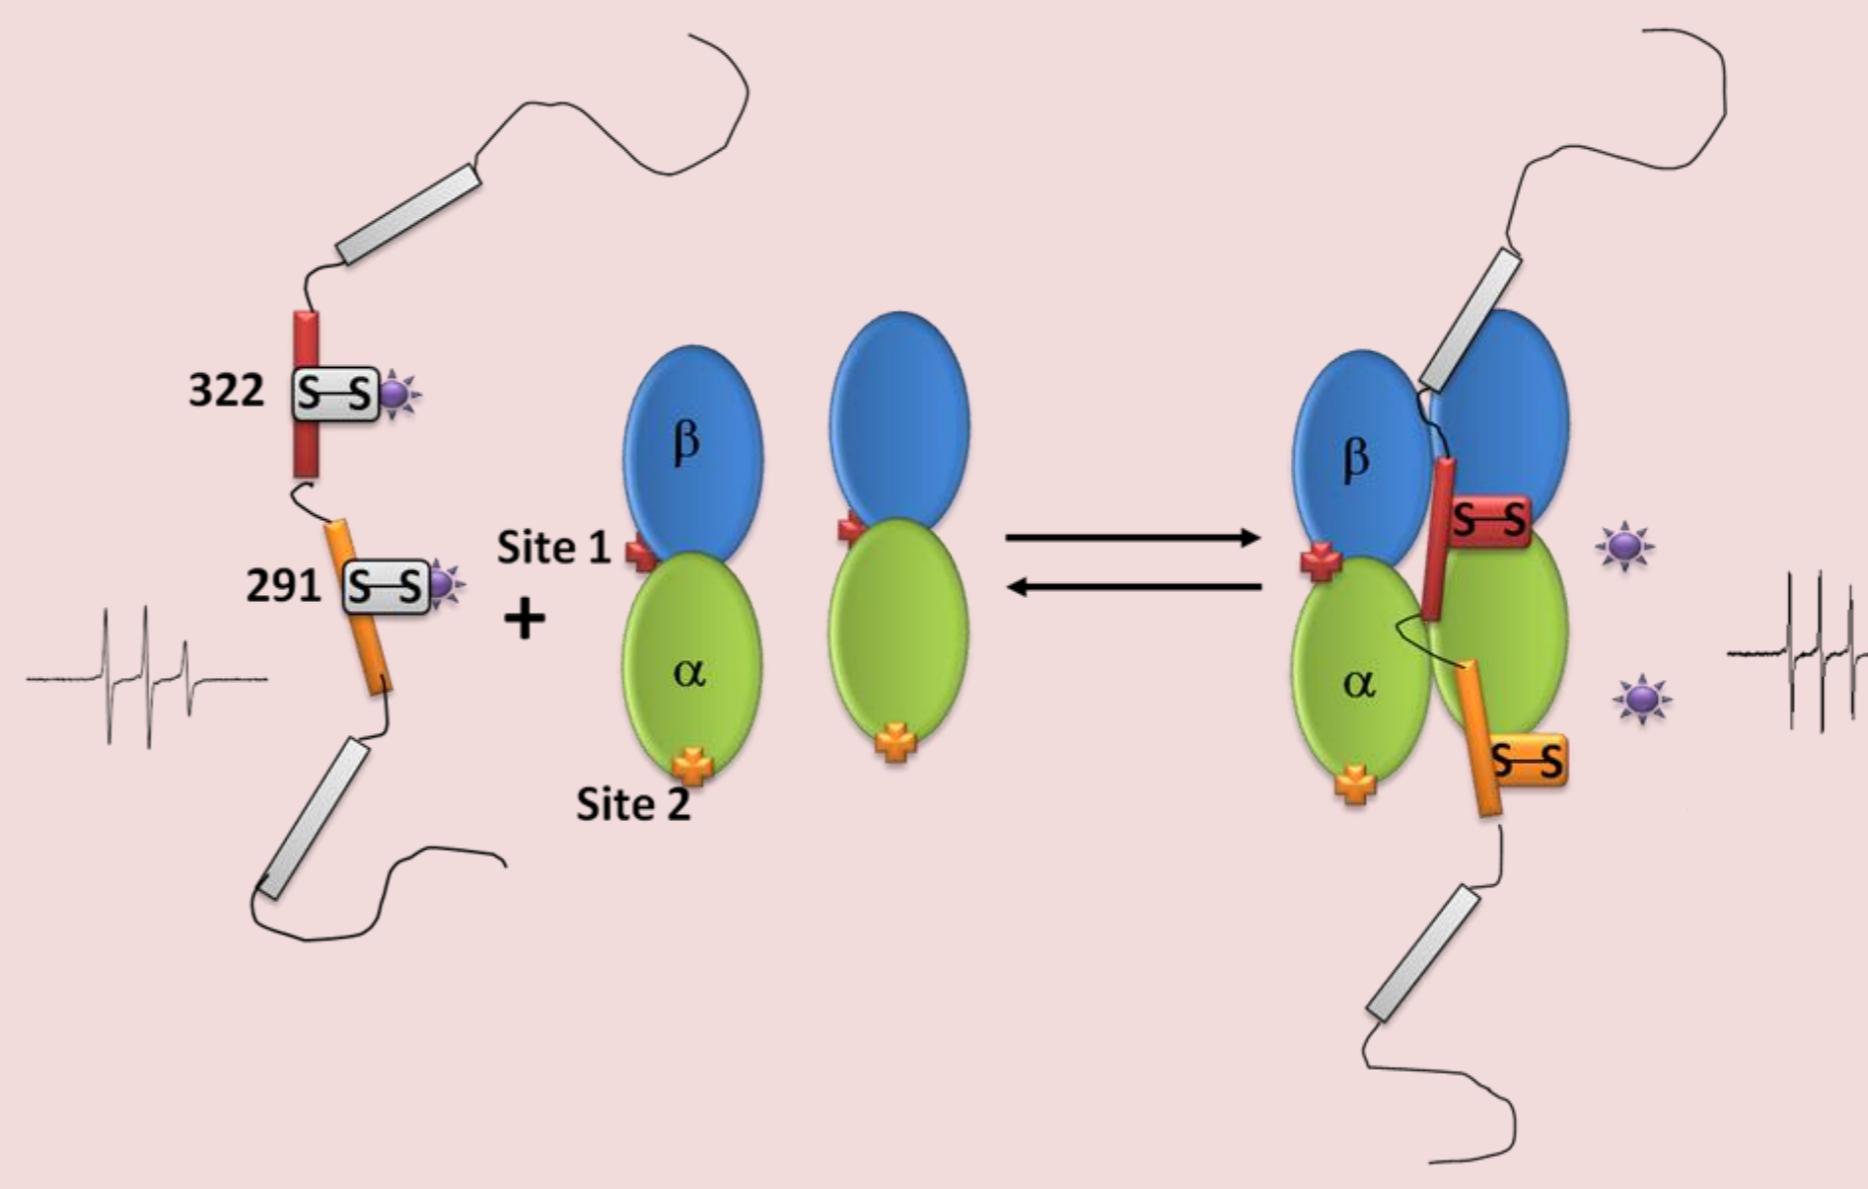

Tau is able to perform a thiol / disulfide exchange with MTs

α C315 and α C316 close to α C347

β C129 close to β C131

α -C347 and β -C131 are good candidates for Tau binding sites on MTs

Ability of Tau to exchange a disulfide bridge with MTs

Unusual use of SDSL-EPR spectroscopy approach

Localization of 2 binding sites
